

TerraZone

truePass MFA

Improved and continuous user authentication is one of the main components in Zero Trust Network Access. Identification Providers and Multi-Factor Authentication providers have improved the authentication process, but the leading 'client-based' approach creates integration and maintenance challenges. Moreover, many non-web applications are not naturally compatible with MFA.

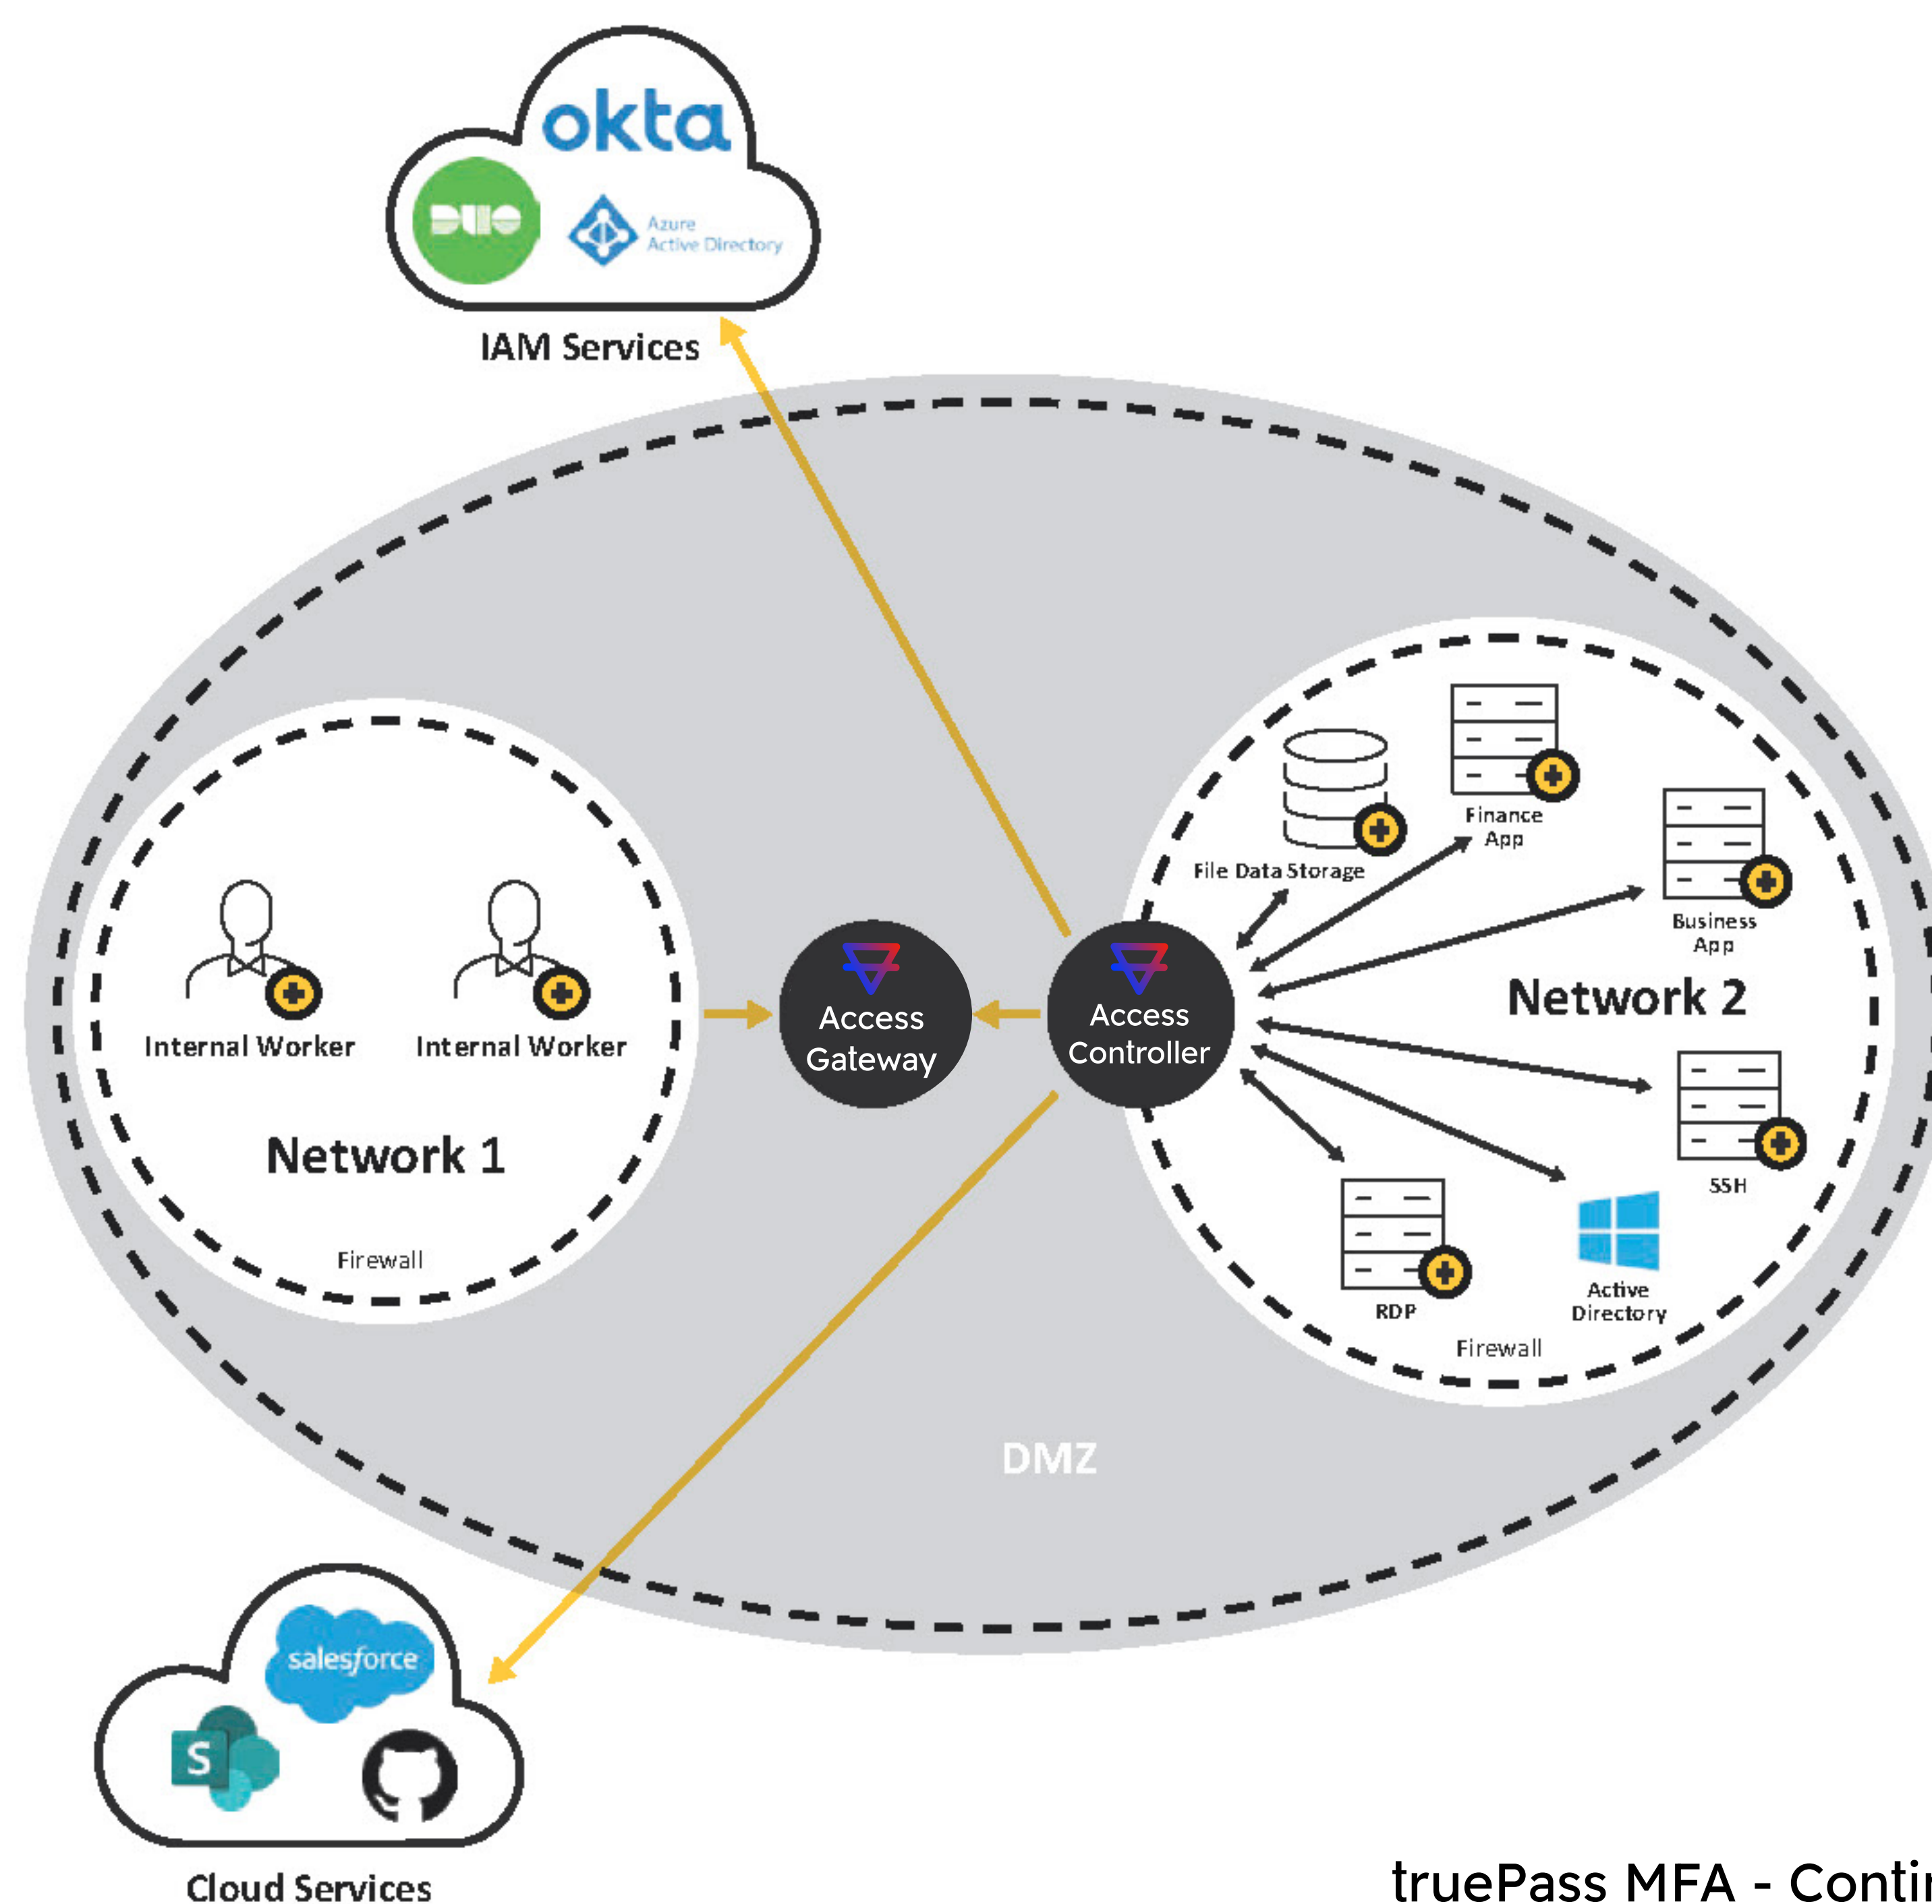

TerraZone truePass MFA centralized approach allows customers to easily integrate Multi-Factor Authentication and identity awareness into all access scenarios - remote and internal users, VPNs, web and non-web applications.

Features

- ▼ Built-in MFA or integration with 3rd party MFA/IdPs
- ▼ Support continuous authentication
- ▼ Application access control policies for internal users
- ▼ User > App and App > App use cases

Benefits

- ▼ Centralized approach - no client side integration
- ▼ Seamless integration - Rapid deployment
- ▼ Upgrade 2FA to true MFA
- ▼ Optimize cost of deployment and ownership

truePass MFA - Continuous authentication
